Academic Level

Recent study on impact of climate change suggests that global temperatures are rising at alarming rate. This has led to increase in frequency of extreme weather events, such as hurricanes and floods. Researchers predict that these trends will continue in coming decades, posing significant challenges for the policymakers. Climate change has also profound effect on ecosystems, with loss of biodiversity and disruption of ecological balance. It is clear that urgent action is required to mitigate negative consequences of climate change and promote sustainable development. Detecting Errors in Academic Writing

The experiment was conducted carefully, but the results were surprising unexpected. The participants were asked to complete a series of complex cognitive tasks, which were heavily challenging. The researchers analyzed the data thoroughly and reached to a cautiously conclusion. The findings were immensely important for the field of psychology, indicating a potentially promising direction for future studies. However, the methodology employing in this research was questionably. The researchers inaccurately measured the variables, leading to an insufficiently accurate representation of the phenomenon. Despite these limitations, the study provided an insightfully understanding into the nature of human behavior and offered a convincingly explanation for the observed phenomena.

Passage

The main environmental problem caused by the production of Greek yogurt is the creation of acid whey as a by-product. Because it requires up to four times more milk to make than conventional yogurt does, Greek yogurt produces larger amounts of acid whey, which is difficult to dispose of. To address the problem of disposal, farmers have found a number of uses for acid whey. They can add it to livestock feed as a protein supplement, and people can make their own Greek-style yogurt at home by straining regular yogurt. If it is improperly introduced into the environment, acid-whey runoff **can pollute waterways (1)**, depleting the oxygen content of streams and rivers as it decomposes. [6] Yogurt manufacturers, **food scientists; and government officials (2)** are also working together to develop additional solutions for reusing whey

Though these conservation methods can be costly and time-consuming, they are well worth the effort. Nutritionists consider Greek yogurt to be a healthy food: it is an excellent source of calcium and protein, serves as a digestive aid, and **it contains (3)** few calories in its unsweetened low- and non-fat forms. Greek yogurt is slightly lower in sugar and carbohydrates than conventional yogurt is. **(4)Also**, because it is more concentrated, Greek yogurt contains slightly more protein per serving, thereby helping people stay satiated for longer periods of time. These health benefits have prompted Greek yogurt's recent surge in popularity. In fact, Greek yogurt can be found in an increasing number of products such as snack food and frozen desserts. Because consumers reap the nutritional benefits of Greek yogurt and support those who make and sell it, **therefore (5)** farmers and businesses should continue finding safe and effective methods of producing the food.

Typically, the ice sheet begins to show evidence of thawing in late summer, following several weeks of higher temperatures. For instance, in the summer of 2012, virtually the

entire Greenland Ice Sheet underwent thawing at or near its surface by mid-July, the earliest date on record. Most scientists looking for the causes of the Great Melt of 2012 have focused exclusively on rising temperatures. The summer of 2012 was the warmest in 170 years, records show. But Jason **Box, an associate professor of geology at Ohio State (7)** believes that another factor added to the **early thaw; (8)** the “dark snow” problem. According to Box, a leading Greenland expert, tundra fires in 2012 from as far away as North America produced great amounts of soot, **some of it (9)** drifted over Greenland in giant plumes of smoke and then **fell (10)** as particles onto the ice sheet. Scientists have long known that soot particles facilitate melting by darkening snow and ice, limiting **it’s (11)** ability to reflect the Sun’s rays. The energy sector has been undergoing major changes, with a decisive shift towards more sustainable sources. Wind energy, in particular, has gained a lot of traction. The reason behind this is not only that wind energy is renewable, but also that it doesn't generate harmful greenhouse gases during operation. However, one drawback to wind turbines is the noise they create, which can be disruptive for nearby residents. Further, the construction of these turbines can also disrupt local ecosystems. Scientists and engineers are looking for ways to mitigate these problems. They're developing quieter turbines and more ecological construction methods, to ensure that the green energy revolution is truly green.
