

# How to deal with too much information

The graph below shows how much visitors to New Zealand spent on average for the years 1996 to 2014. Summarise the information by selecting and reporting the main features, make comparisons where relevant.

The line graph compares the spending of visitors in New Zealand from 5 different nations, such as from the US, and Australia, over an 18-year period from 1996 to 2014, measured in New Zealand dollars.

Overall, it can be clearly observed that while **the average spending of** visitors to New Zealand from all countries experienced an upward trend, **that of** Japanese visitors remained consistent despite some fluctuations across the given time frame.

Starting in 1996, at over 1,000 NZ dollars on average, the spending of Australian tourists was the highest among tourists of all countries, followed by **that of** American, Japanese, Chinese, and British tourists, at roughly 800, 450, 400, and less than 100 NZ dollars, respectively.

**Interestingly**, the spending of visitors of all countries, except China, increased **at different**

**rates. For example,** while the figure for Australian tourists rose dramatically to over 1,500 NZ dollars, that of American visitors grew slightly from 800 to just over 900 NZ dollars.

From 2002 onwards, the average expenditure of tourists from every country experienced an increase, **for instance,** the spending of Australian tourists dropped to approximately 2,000 NZ dollars in 2014 after peaking at over 2,500 NZ dollars in 2006. **On the other hand,** the expenditure of Japanese travelers fall continuously back to 500 NZ dollars in 2014 after reaching its peak at just over 1,000 NZ dollars in 2002.

#### KEY TAKEAWAY

- Do not write every number. Choose on the important ones.
- Use “for example” and “for instance”
- Use the word “at different rates”.
- When in doubt about which information is (more) important, go back to read your overview!
